01 Who You're Meeting

George Kurtz — Founder & Chief Executive Officer, CrowdStrike.

In role: Co-founded CrowdStrike in 2011 and has led it since

Today: Sets CrowdStrike's strategy, currently around consolidating fragmented security spend onto Falcon and positioning it as the operating system of cybersecurity for the agentic AI era.

A security practitioner who has built this company twice over. He began in accounting and security consulting, holding senior security roles at PricewaterhouseCoopers and Ernst & Young, then founded Foundstone in October 1999 — recruiting the other six founders himself — and built it into a worldwide security products and services firm with one of the industry's leading incident response practices. McAfee acquired it in October 2004 and he stayed, rising to Worldwide Chief Technology Officer, General Manager and SVP of Enterprise at what was then a multi-billion-dollar security business.

Career: Co-Founder, President & Chief Executive Officer, CrowdStrike; Entrepreneur-in-Residence, Warburg Pincus; Worldwide Chief Technology Officer, General Manager, SVP Enterprise, McAfee; Founder & Chief Executive Officer, Foundstone (acquired by McAfee, 2004)

Education: BS Accounting, Seton Hall University

The company: Reached \$5.25B of ending ARR in FY2026 — the fastest and only pure-play cybersecurity software company to do so — while expanding non-GAAP operating margin by 370 basis points. Kurtz frames the market as consolidating onto Falcon as the operating system of cybersecurity for the agentic AI era.

What they sell: The Falcon platform, sold as modules across endpoint, identity, cloud, exposure management and next-generation SIEM, with Charlotte AI providing agentic detection and response. Falcon Flex is the consumption-style licensing model driving consolidation onto the platform.

02 Where The Company Sits

The platform consolidation thesis is doing the work here. Falcon Flex lets customers commit spend and draw down across modules, and the module adoption numbers show it landing — 49% of customers on six or more modules, 24% on eight or more. For a portfolio owner that is the relevant mechanic: it is a vehicle for consolidating fragmented security spend across assets rather than a point product.

03 Talking Points

- A genuine practitioner, not a career executive — a technical conversation about detection architecture will land, a procurement pitch less so.
- He spent seven years inside McAfee watching a legacy model fail; he is unusually alert to incumbency and complacency arguments.
- The July 2024 outage is unavoidable context in any critical-infrastructure conversation. He has addressed it publicly; expect him to, and be specific about what assurance you need.

What to pressure-test about the company:

- Q4 FY2026 revenue of \$1.31B came in below the Wall Street consensus of roughly \$1.4B despite 23% growth
- The July 2024 outage remains the reference point for single-vendor concentration risk in critical infrastructure
- Management's \$10B ARR ambition implies sustained high growth against increasingly large comparatives

04 GIP Context

GIP: No publicly disclosed GIP relationship. Security tooling is one of the more plausible areas for genuine portfolio-level leverage — consolidated commercial terms across PortCos — and sits squarely in the Technology / Governance / Security prerequisite of the reference model.

BlackRock: No publicly disclosed operating relationship; standard index holdings of CRWD only.

Others at CrowdStrike: Burt Podbere (Chief Financial Officer)
