Fortune 100 on Gemini Ent.

01 Who You're Meeting

Thomas Kurian — Chief Executive Officer, Google Cloud, Google.

In role: Appointed November 2018, taking the role in January 2019, succeeding Diane Greene

Today: Runs Google Cloud — infrastructure, the Gemini Enterprise Agent Platform, custom silicon and the enterprise go-to-market — now growing 82% with a \$514B backlog.

Twenty-two years at Oracle before Google, which is precisely why he was hired. He rose through Oracle to lead product development and its cloud computing effort, sat on its Executive Committee for thirteen years, and was responsible for products generating tens of billions in annual revenue — so he learned enterprise software selling at the company that arguably invented the modern version of it. He began his career at McKinsey for around six years, working with CEOs across financial services and telecommunications.

Career: Chief Executive Officer, Google Cloud; President of Product Development; Executive Committee member (13 years), Oracle; Consultant, financial services and telecommunications, McKinsey & Company

Education: BSE Electrical Engineering, Princeton University; MBA, Stanford Graduate School of Business; Studied at IIT Madras before transferring to Princeton

The company: Google Cloud accelerated from 48% growth in Q4 2025 to 63% in Q1 2026 to 82% in Q2, with backlog reaching \$514B. Gemini processes roughly 22 billion tokens per minute through direct API use, and nearly 90% of the Fortune 100 use Gemini Enterprise.

What they sell: Google Cloud infrastructure and the Gemini model family, plus the Gemini Enterprise Agent Platform (formerly Vertex AI), Workspace Studio for no-code agent building, and custom silicon — Ironwood TPUs, with an eighth generation splitting into Broadcom-designed training chips and MediaTek-designed inference chips.

02 Where The Company Sits

Kurian's competitive argument is that rivals hand customers components rather than an assembled platform, and the vertical integration behind that claim is real — Google is the only player owning custom silicon, frontier models, developer platform and consumer distribution under one roof. For an infrastructure portfolio, two commercial mechanics matter more than the architecture: Kurian has said most Google Cloud infrastructure contracts run about five years, and that customers committing \$100 of spend typically end up spending more than \$150.

03 Talking Points

- Twenty-two years at Oracle — he knows exactly how Oracle prices and sells, which matters given Oracle's own AI infrastructure push.
- He rebuilt Google Cloud's enterprise go-to-market from scratch, so account coverage and support commitments are things he can actually change.
- The five-year contract norm and the \$100-becomes-\$150 expansion pattern are his own public statements. Use them.

What to pressure-test about the company:

- 2026 capital expenditure guidance raised to \$195–205B, and free cash flow turned negative in Q2 2026
- Backlog figures vary noticeably between sources and presentation dates — use Alphabet's filings, not conference coverage
- Enterprise support and account management remain the historical objection against Google relative to AWS and Azure

04 GIP Context

GIP: No publicly disclosed GIP relationship. Google Cloud is near-certain to be present in some PortCos already, so the practical question is consolidated commercial terms rather than a first introduction.

BlackRock: No publicly disclosed operating relationship; standard index holdings of GOOGL/GOOG only.

Others at Google: Sundar Pichai (Chief Executive Officer, Alphabet & Google)
