01 Who You're Meeting

Alexandr Wang — Chief AI Officer; lead of Meta Superintelligence Labs, Meta.

In role: Joined Meta in June 2025 as its first-ever Chief AI Officer, leading Meta Superintelligence Labs

Today: Shapes Meta's AI vision and drives its strategic initiatives from concept to execution, leading Meta Superintelligence Labs alongside Meta's other AI product and research teams.

A founder rather than a corporate executive, and he arrived through one of the largest acqui-hires in the industry's history. He founded Scale AI in 2016 as a 19-year-old MIT student, building it in a Silicon Valley pool house through Y Combinator with co-founder Lucy Guo. Scale became the data and infrastructure layer behind most leading models across the industry and reached a valuation of nearly \$29 billion. In June 2025 Meta invested \$14.3 billion for a 49% stake in Scale and brought Wang in to lead the newly created Meta Superintelligence Labs; he remained on Scale's board.

Career: Chief AI Officer; lead of Meta Superintelligence Labs, Meta; Founder & Chief Executive Officer, Scale AI

Education: Massachusetts Institute of Technology (left to found Scale AI)

The company: The only hyperscale AI spender whose infrastructure is almost entirely self-consumed — there is no Azure or AWS equivalent selling capacity to third parties. 2026 capital expenditure guidance has been raised three times to \$135–145B, roughly double the \$72.22B actually spent in 2025, while the company cuts 10% of its workforce.

What they sell: Facebook, Instagram, WhatsApp and Reality Labs on the consumer side; the Llama open-weight model family and, from 2026, Meta Superintelligence Labs, whose first proprietary model is Muse Spark. Custom MTIA silicon is being built to reduce dependence on NVIDIA.

02 Where The Company Sits

Meta's relevance to an infrastructure portfolio is not as a vendor — it sells advertising, and Llama is given away. It matters as a counterparty and a demand driver. The most directly relevant fact in this research pass: in the week before Q2 2026 earnings, Meta and BlackRock announced a \$14B El Paso data centre joint venture with BlackRock funds holding 80%, which lets Meta de-consolidate significant capex from its balance sheet.

03 Talking Points

- His actual expertise is data infrastructure for training models — closer to the Data Foundation problem than to applications.
- Meta's model strategy shifted under him from strictly open-weight to proprietary. If a PortCo's case rests on open weights, test how durable that is.
- His remit was restructured in March 2026. Confirm who owns what before relying on any commitment.

What to pressure-test about the company:

- Almost all capex is self-consumed — unlike Microsoft and Amazon, Meta has no third-party cloud revenue to offset the buildout
- Capex guidance raised three times to \$135–145B, roughly double 2025, while GPU-heavy assets depreciate over a 4–6 year life
- Meta extended its depreciation assumption to 5.5 years in 2025, worth nearly \$2.9B of reported profit — an accounting tailwind, not an operating one

04 GIP Context

GIP: No publicly disclosed direct GIP relationship. However, the \$14B El Paso data centre joint venture with BlackRock funds at 80% ownership is the closest adjacency of any vendor in this app — confirm internally how that structure sits relative to GIP's own digital infrastructure mandate before treating Meta as a straightforward third party.

BlackRock: Direct and material: a \$14B El Paso data centre joint venture announced in 2026, with BlackRock funds owning 80%. This lets Meta move significant capital expenditure off its own balance sheet while BlackRock takes the infrastructure...

Others at Meta: Mark Zuckerberg (Founder, Chairman & Chief Executive Officer)
