01 Who You're Meeting

Jensen Huang — Founder & Chief Executive Officer, NVIDIA.

In role: Founded NVIDIA in April 1993 and has served as president, CEO and a board member since inception

Today: Sets NVIDIA's strategy across accelerated computing — the Blackwell and Vera Rubin platforms, networking, and the physical AI and robotics businesses — and is the industry's most consequential voice on compute supply.

A chip designer who has run the same company for more than three decades, which is close to unique at this scale. He earned a BSEE from Oregon State University in 1984 and joined AMD as a microprocessor designer, then moved to LSI Logic where he worked across engineering, marketing and general management, rising to run a division — and took an MSEE from Stanford while working.

Career: Founder, President & Chief Executive Officer, NVIDIA; Engineering, marketing and general management; division director, LSI Logic; Microprocessor designer, Advanced Micro Devices (AMD)

Education: MSEE, Stanford University; BSEE, Oregon State University (1984)

The company: FY2026 revenue of \$215.9B, up 65%, with Data Center at 90% of the total. Huang has said cloud GPUs are sold out, that NVIDIA expects at least \$1 trillion of cumulative Blackwell and Vera Rubin revenue through 2027, and bluntly that supply will fall short of demand.

What they sell: GPU and rack-scale accelerated computing — the Blackwell and Grace Blackwell platforms, with Vera Rubin ramping — plus NVLink interconnect, BlueField data processors, networking, and the CUDA software stack. Automotive and robotics run through DRIVE and the Alpamayo open model family.

02 Where The Company Sits

Two things here matter to an infrastructure portfolio more than the headline numbers. First, NVIDIA reported \$6B of physical AI revenue in FY2026 — robotics, autonomous mobility, industrial systems — which makes it one of the few vendors in this app putting a disclosed figure against the category most relevant to operating assets.

03 Talking Points

- An engineer running his own company for 33 years — he engages on architecture and physics, not procurement.
- NVIDIA reported \$6B of physical AI revenue in FY2026. That is the line closest to operating infrastructure; ask what is actually in it.
- Access runs through the hyperscalers, not direct. He sets availability and price for everyone; he is not a vendor you negotiate with.

What to pressure-test about the company:

- The stock fell after each of the three most recent results despite beating expectations 18 times in 20 quarters — expectations may have reached unattainable levels
- Customer concentration is extreme: a handful of hyperscalers and frontier labs drive the majority of Data Center revenue, and their capex plans are the single point of...
- AMD's Helios rack-scale system is expected to compete directly with Vera Rubin

04 GIP Context

GIP: No publicly disclosed GIP relationship. NVIDIA is relevant to the portfolio mainly as a supply constraint and a demand driver — its capacity decisions set the cost and availability of compute for every AI programme, and its partnerships with Google Cloud, Microsoft, Oracle and xAI to build US AI infrastructure make it a direct influence...

BlackRock: No publicly disclosed operating relationship; standard index holdings of NVDA only.
